James Walter - CS340 Assignment 3 Reflection - jwal404

This assignment allowed me to understand that a directory in xv6 is really just a file that stores a list of names pointing to other files, and it only really clicked once I was working on the disk usage task and had to figure out how a folder's size actually gets counted.

The hardest part for me was the third task - adding a timestamp to the files. I had to make sure every piece of code that could modify a file would update the timestamp, which took a lot of analyzing.

Because I'm still learning remotely, I really struggled with this assignment. Because I can't attend many lectures or tutorials, a lot didn't make sense straight away.
